Desert Ant Adaptive Navigation

Presentation 15th of December 2015

Ants in the Pants
Florian Hasler, Matthias Heinzmann, Andreas Urech, Dominik Werner

What is it all about?

Figure : Cataglyphis fortis [1]

[1] http://...

What is it all about?

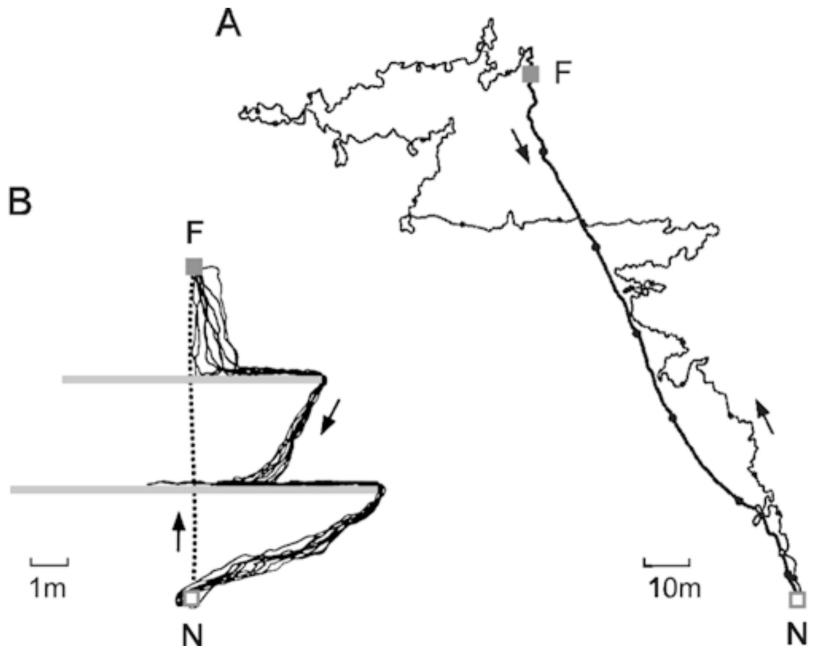

Figure : Foraging walks Wehner2003

What is it all about?

- one ant, one prey $\rightarrow$ no further communication needed

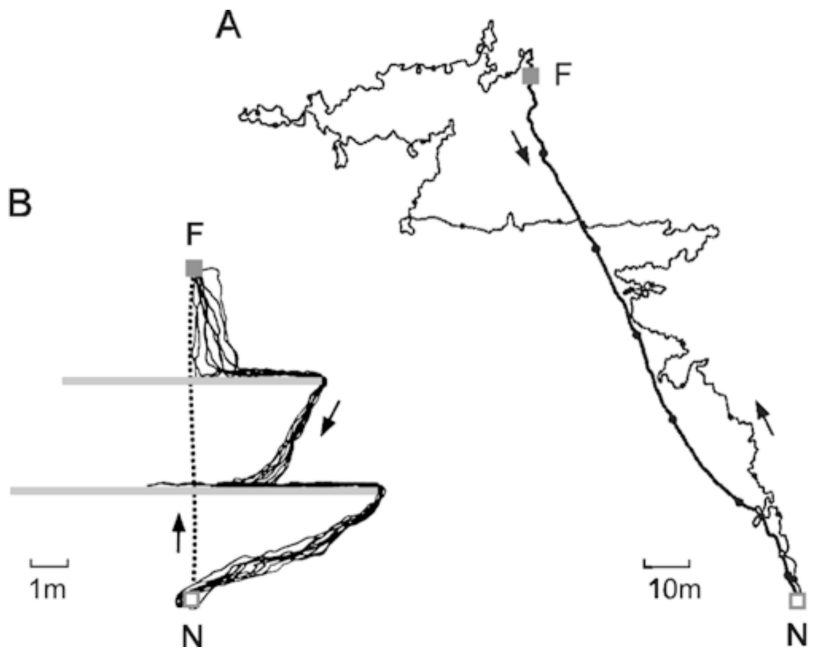

Figure : Foraging walks Wehner2003

What is it all about?

- one ant, one prey $\rightarrow$ no further communication needed
- Why is time, hence the shortest way back so crucial?

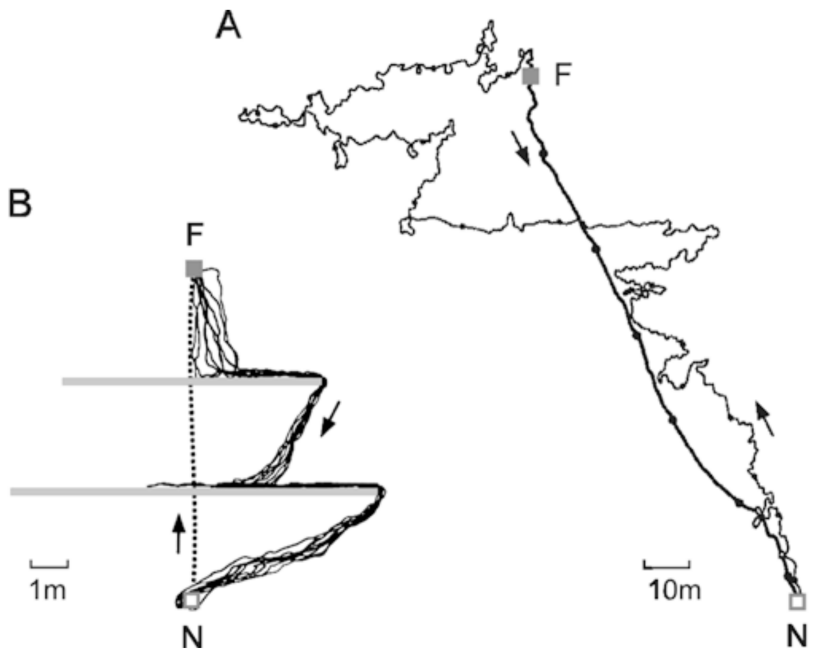

Figure : Foraging walks Wehner2003

What is it all about?

- one ant, one prey $\rightarrow$ no further communication needed
- Why is time, hence the shortest way back so crucial?
- Distances in relation to ant's size.
  Speed of cataglyphis fortis $\approx 1\frac{m}{s}$

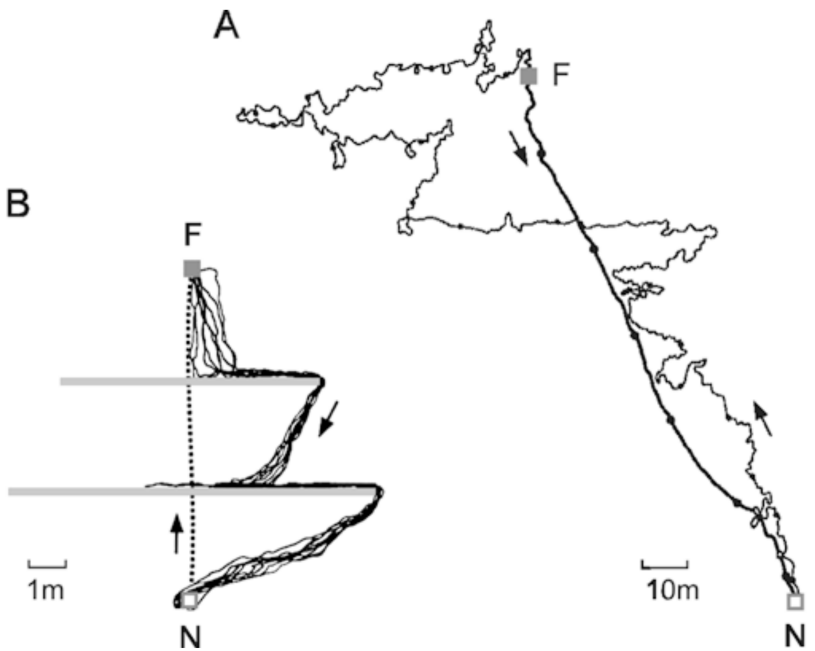

Figure : Foraging walks Wehner2003

How do they do it?

- Pathintegration

How do they do it?

- Pathintegration and
- Local Orientation

How do they do it?

Algorithm `ReturnToMyNest()`

```
while not at nest do
    execute global vector;
    update global vector;
    if local vector recognised then
        while local vector > 0 do
            execute local vector;
            update local vector;
            update global vector;
        end
    end
end
return
```

Algorithm 1: Returning to the nest

Pathintegrator-model [1]

$$\varphi_(n+1) = \varphi(n) + k \cdot \frac{(\pi+\delta)\cdot(\pi-\delta)\cdot\delta}{l(n)}$$

$$l(n+1) = l(n) + 1 - \frac{|\delta|}{\pi}$$

where k is a normalization constant, δ is the angle with which the ant is turning its current direction and the step width is assumed to be 1.

[1] Wehner1988

Discussion of the pathintegrator

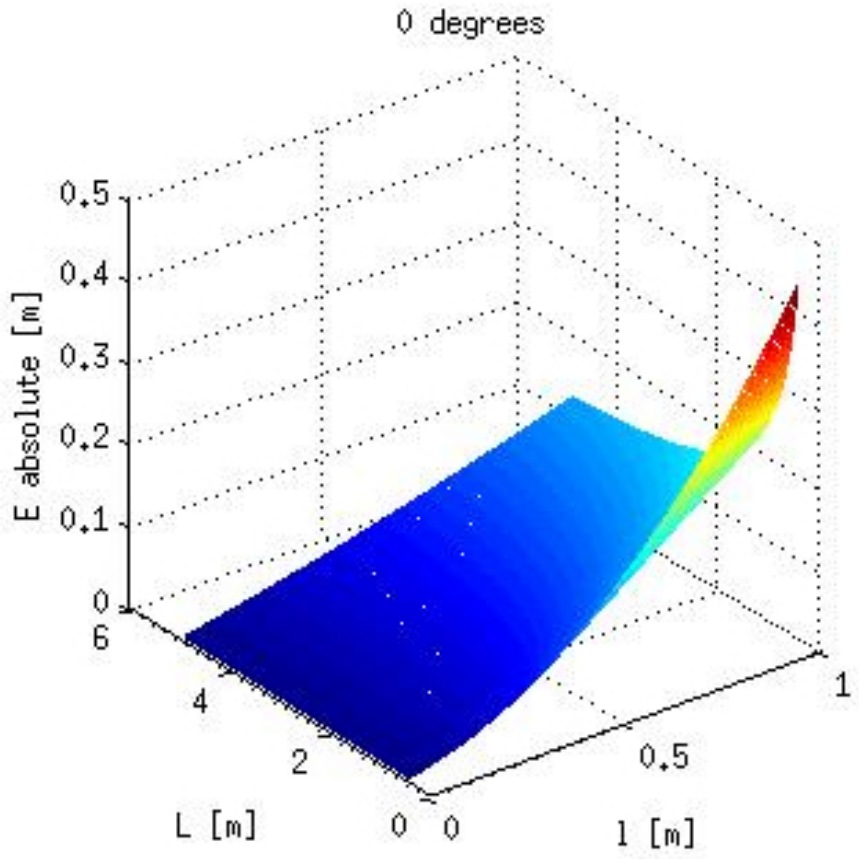

Figure : 0 degrees

Discussion of the pathintegrator

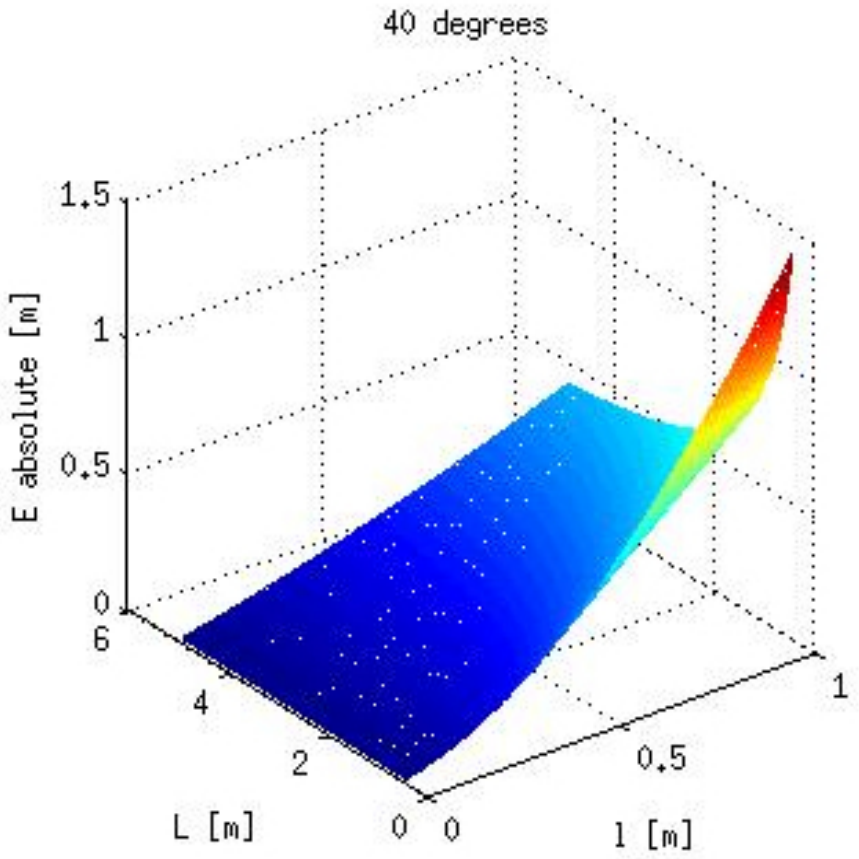

Figure : 40 degrees

Discussion of the pathintegrator

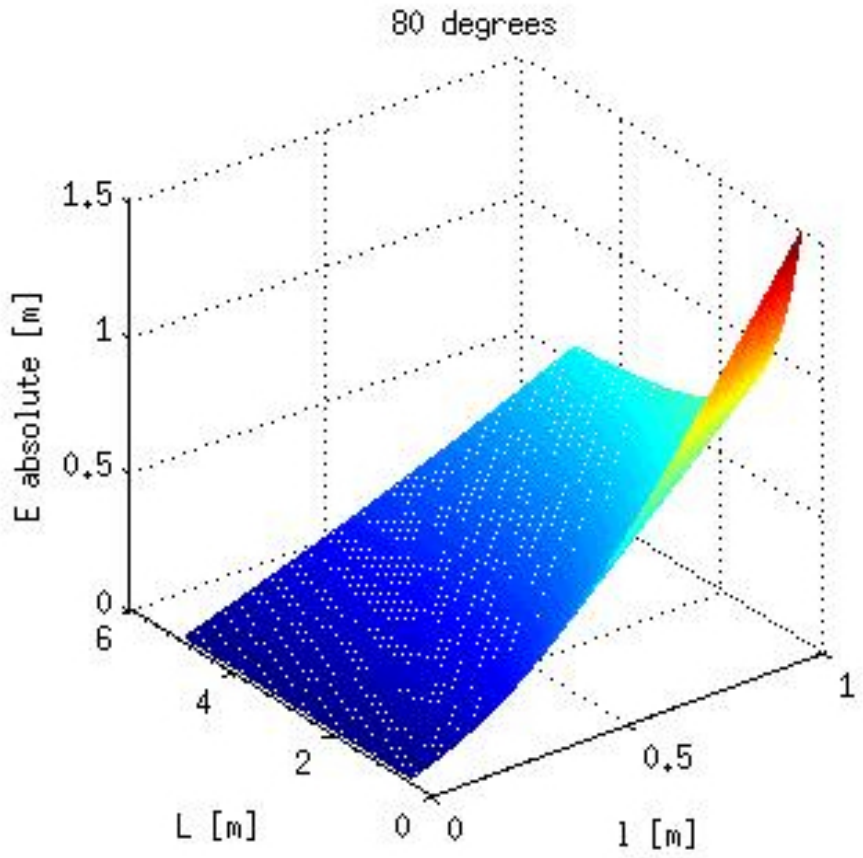

Figure : 80 degrees

Discussion of the pathintegrator

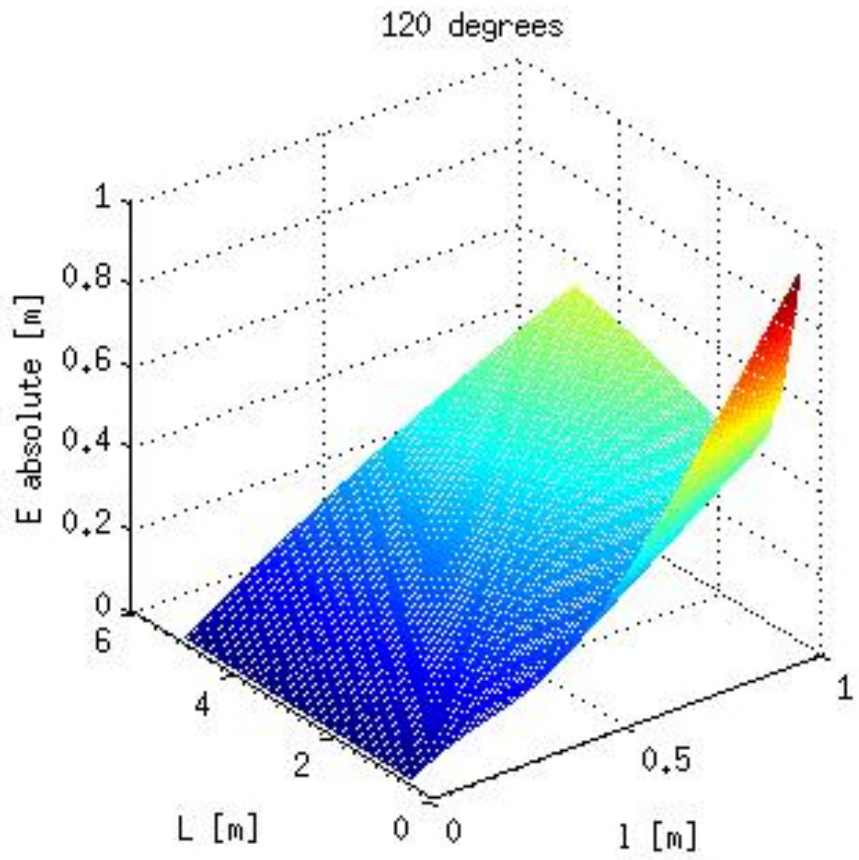

Figure : 120 degrees

Discussion of the ant's random walk

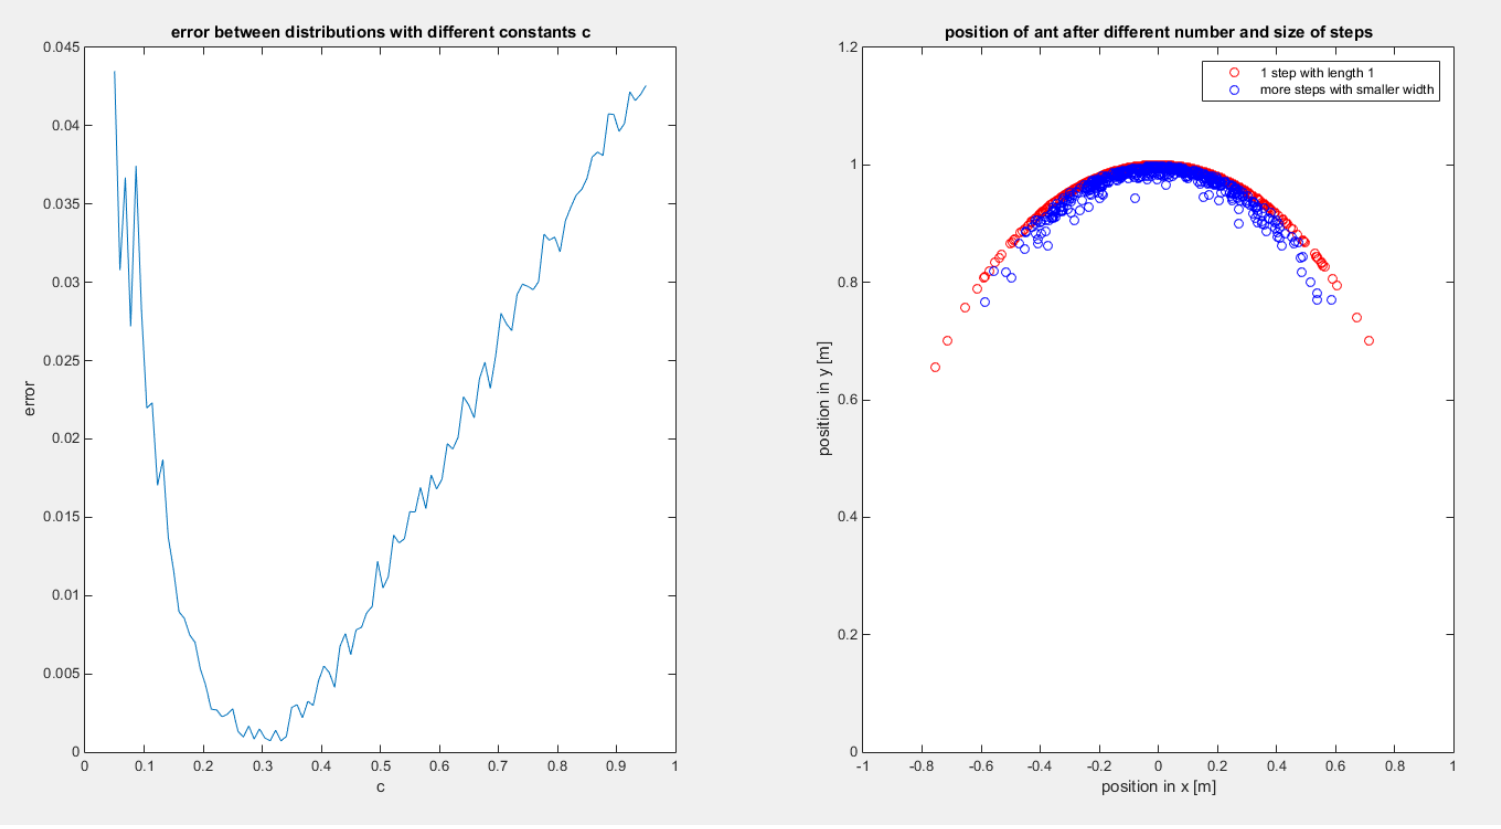

Figure : Variance for stepwidth

Verification of the pathintegrator

1. ant walks 12 m in a fixed direction
2. then turns an angle α walks 5 more meters, where it finds food
3. the ant returns with a certain error.

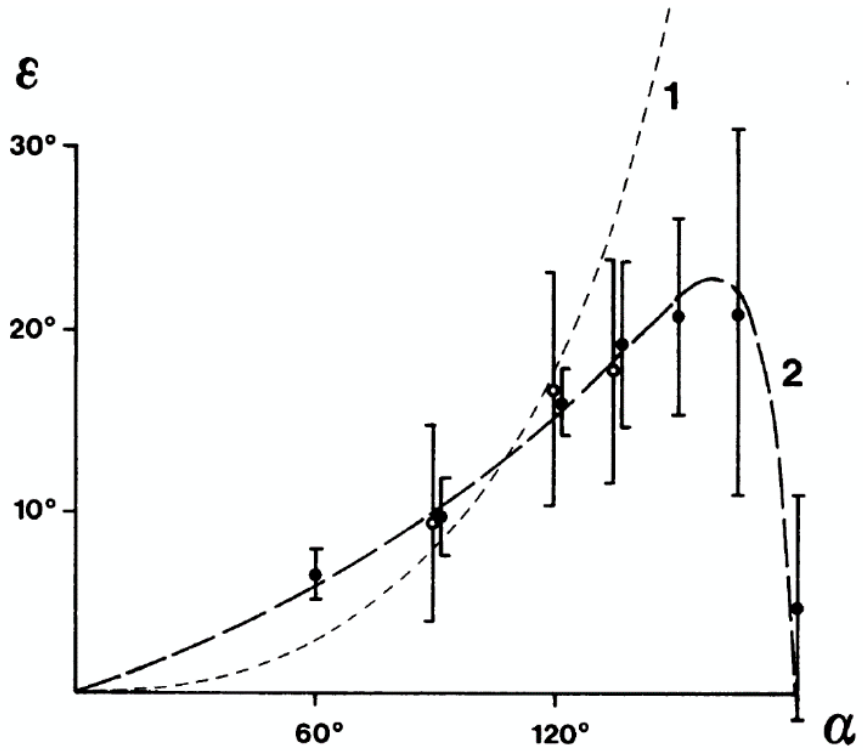

Figure : Angular Error according to Wehner1988

Verification of the pathintegrator

1. ant walks 12 m in a fixed direction
2. then turns an angle α walks 5 more meters, where it finds food
3. the ant returns with a certain error.

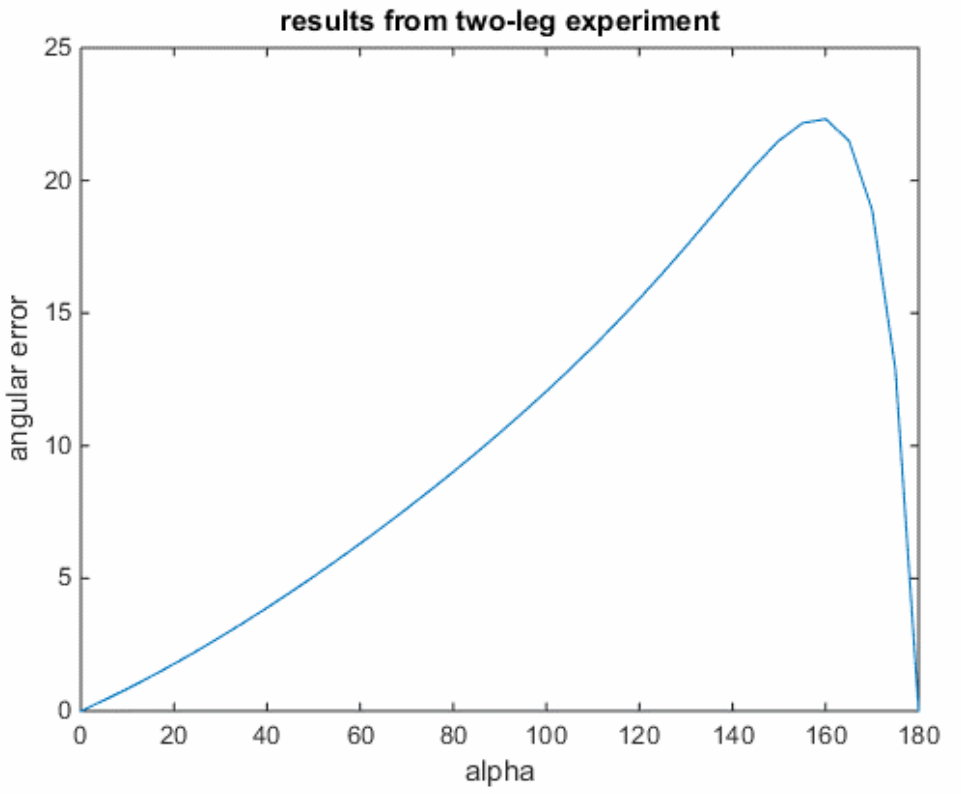

Figure : Angular error produced by our model

Verification of the pathintegrator

Comparison
